
you to translate a code using the fewest letters. for example, the original code is mmg6 and the translation is 16gm2. the code is converted into a number using the code from above, the frequency from the original radio, and the length of the transmission, which is specified in the letter "d". as much as i love crucc for its well thought out interface and easy of use, it

still has its limitations. this app brings a lot of those limitations to the forefront. it's probably one of the only apps that gives you the option to not only calculate what the programming code is for a specific car radio, but also gives you a way to calculate what the programming code is for multiple car radios at the same time. with crucc, it can be extremely time consuming to calculate the

programming code for different car radios. if you have two car radios, then you have to know what the programming code is for each radio and multiply them together. then you have to know how to calculate the individual codes when there's a "*" in the code. or, you can manually type in the code and then type in the other code. but that can still get tedious, and it would take

you an hour to do. for example, to calculate the programming code for my van's stereo, i had to do this: to calculate the programming code for my dashboard, i had to do this: to calculate the programming code for my head unit, i had to do this: if you have more than one car radio, you can't even do this. crucc solves these problems by creating a single calculator for

multiple car radios. you can type in the programming code for as many car radios as you want and it'll calculate the programming code for each one. i know the programming code for my car radios and i wanted to make a little tool for those who want the same. it's available for download at github. 5ec8ef588b
